

Approach Funnel by Arm. Note. Each bar is the share of an arm's 540 wind-stage legs that reached the step at least once, truth channel: within 10 m, 3 m and 1.5 m of the boom-tip; inside the M3b envelope; inside it for 1 s and for 3 s in all (cumulative, not continuous); and a capture under the four conditions of the "Decision Rules" section. Whisker = two-sided 95% seed-cluster bootstrap interval; the label is the leg count and the rate (count ÷ 540), on the bar, or above the bars with the arm name where they are too short for it. In each group the bars run S1O, S1, A2O, A2, PIDO, PID. Dark bars = with the 0.25 m offset (S1O, A2O, PIDO); light bars = without it (S1, A2, PID). Top: light turbulence (σ = 0.25); bottom: moderate turbulence (σ = 0.35). Nine wind stages pooled. Amplifying; decides no hypothesis.
