

H1 Statistic by Trajectory. Note. Column = corridor p95 of each arm's per-leg peak height above the boom-tip, truth channel, σ = 0.25; whisker = its two-sided 95% seed-cluster bootstrap interval; n = legs that entered the corridor. Dotted orange line = 2.00 m H1 bar; solid red line = 3.42 m DHC-2 airframe contact plane; shaded band = the 1.42 m built-in margin. Dark columns = with the 0.25 m offset (S1O, A2O, PIDO); light columns = without it (S1, A2, PID). Lower is better. Each panel holds one DHC-2 trajectory, nine wind stages pooled, 270 legs or same-seed pairs per arm. No trajectory panel is graded; the hypotheses are graded on both trajectories pooled. Amplifying; decides no hypothesis.
