
H2 Statistic by Trajectory. Note. Capture = truth and perception both inside M3b for 3.0 s (the "Decision Rules" section). Marker = each arm's same-seed difference in docking-envelope captures from the PID-baseline, σ = 0.25; whisker = its two-sided 95% seed-cluster bootstrap interval. The rate above each marker is the arm's capture rate on that trajectory; the value below it is the difference; the interval ends are under the whisker caps. Dotted green line = 0 pp, the PID-baseline. Hollow marker = with the 0.25 m offset; filled = without. The 35% reference floor is defined on both trajectories pooled and is not drawn. Each panel holds one DHC-2 trajectory, nine wind stages pooled, 270 legs or same-seed pairs per arm. No trajectory panel is graded; the hypotheses are graded on both trajectories pooled. Amplifying; decides no hypothesis.
